“The body”: a challenge for patients with eating disorders and their therapists

Prof. dr. Michel Probst, PT
KU Leuven, Fac. Kinesiology & Rehabilitation Sciences
President International Organization of Physical therapy in Mental Health
Learning objective

To obtain new insights/therapeutic skills valuable for the approach of body image in therapy.
What happens when you eat?

- **Physical consequences of eating:**
  - The food sinks into the oesophagus, the stomach to the intestine.
    - The reaction of our body after a meal is a relay of processes.

- **Psychological consequence of eating**
  - The food is going to the head
    - Chaos related to food, weight and appearance
    - Influencing the thoughts (dysfunctional thinking), emotions, (unhelpful) behavior
Physical consequence of disordered eating

• A disturbance in the movement pattern of the stomach (gastric motility). [a reduced motor function of the lower part of the stomach & a reduced relaxing power (adaptive relaxation) of the upper portion of the stomach.

• Intestinal gas: mean of 150 ml

• Body fat (BF): a pursuit of a fatless body

Mean BF female under 30 year: 26%-30 BF. Mean 21% BF = fertility. Mean 18% BF= the point of amenorrhea. Under 10% BF= life-threatening. No relation between BF and BMI.
Cornerstones for body image approach in eating disorders
An amelioration of a dysfunctional body image is necessary for effective treatment of ED [Bruch, 1973]
Anorexia nervosa

• Patient refuses to maintain normal body weight

• BMI less than 17.5
  • weight/ height²

• an intense fear of gaining weight or of becoming fat.

• Disturbance in the way one's body weight or shape is experienced.
Bulimia nervosa

• Person binge eats.

• Feels out of control while eating

• Self-evaluation is unduly influenced by body shape and weight
  - Fear of being fat
  - Believes self-worth requires being thin.

• Recurrent inappropriate compensatory behaviour: excessive exercise
Binge Eating Disorder DSM V

A. Recurrent episodes of binge eating. An episode of binge eating is characterised by both of the following:
   i. Eating, in a discrete period of time, an amount of food that is definitely larger than most people would eat during a similar period of time and under similar circumstances.
   ii. A sense of lack of control over eating during the episode

B. The binge eating episodes are associated with three (or more) of the following:
   - eating until feeling uncomfortably full
   - large amounts of food when not feeling physically hungry
   - eating alone because of feeling embarrassed
   - feeling disgusted with oneself, depressed, or guilty afterwards
Talking about body image

Body image therapy as a tool to break through the disturbed body image and the hyperactivity in patients with eating disorders.

Body image therapy focuses on the perception, the emotions and the behavior and the healthy possibilities.

Internal experience and practising exercises

Enlarge the comfort zone
Self-concept: multidimensional & hierarchical structure

Global self concept

Academic self concept
- English
- Science

Non-academic self-concept
- Social self-concept
- Physical self-concept
- Emotional self-concept

(Shavelson et al., 1976; Marsh, 1997; Fox, 1989; Fortes et al., 2004; Kowalski et al., 2003; Morin et al., submitted)
Self concept (theory of Marsh, Fox e.a.)

- **Physical self concept** / Impression / Physical self / living in the body
- **Psychological self concept** / Emotional self concept / Expression / living in relation
- **Social self concept** / Communication / Environment / Relations / living in society

Edgar Degas
1834-1917
Body image

Body experience

P. F. Schilder (1886-1940)

Thomas Cash (°1947)

The picture of our own body which we form in our own mind or the way the body appears to ourselves”

Schilder, 1935

«Body image is a multi-faceted concept that refers to persons’ perceptions and attitudes about their own body, particularly but not exclusively its appearance» (2003)
Relation $r = 0.60$
$R^2 = 40\%$

Hierarchical model
A complex experience

• Patients are able to estimate correctly neutral objects
• Patients are not able to estimate their own body size
• Patients are able to estimate correctly the body size of others.
• Patients estimate their ideal body size larger than the real body size
• When patients measure themselves, they are surprised by the true dimensions of the body size.
• Gut feeling is based on wrong assumptions
TAKE CARE OF YOUR BODY. IT’S THE ONLY PLACE YOU HAVE TO LIVE IN.
When fear and anxiety become a disorder?

When do you become your own terrorist?
John Locke, "Association of ideas" 1690

Metaphor: war
The armistice: war is over.
One has to be on the alert against unforeseen situations.
There is freedom. One can be more relaxed.
One needs time to become familiar with the new situation.
One can start making plans for the future.
One can rebuild a new life.
To feel free in their body.
To live comfortably in their body.

No More War!

Structure,
Future,
The focus is on the positive body parts and on the negative body parts of the others.

Subject without an with symptoms of ED

Self-perception

Cognitive Distortions

Emotions

Social Anxiety

The focus is on the negative body parts of the self and on the positive body parts of others.

(Jansen et al., 2005)

Perception of others
A sum!

- $5 \times 4 = 20$
- $48 + 8 = 56$
- $32 - 11 = 21$
- $12 \times 3 = 39$
- $55 : 5 = 11$
- $45 + 21 = 66$
- $76 - 9 = 68$
- $7 \times 8 = 56$
- $64 : 8 = 8$
- $15 \times 4 = 60$

- $5 \times 4 = 20$
- $48 + 8 = 56$
- $32 - 11 = 21$
- $12 \times 3 = 39$
- $55 : 5 = 11$
- $45 + 21 = 66$
- $76 - 9 = 68$
- $7 \times 8 = 56$
- $64 : 8 = 8$
- $15 \times 4 = 60$

2 mistakes
8 Correct answers
Body image and physical activity

Anorexia nervosa restrictive type
The relation between questionnaires measuring the attitude of body image and physical activity
\[ r = 0.50 \]
Drive for exercise!

- Compulsive exercise, compulsive physical activity, diffuse restlessness, drive for activity, elevated physical activity, excessive exercise, excessive physical activity, exercise addiction, extensive exercise, high level exercise, hyperactivity, motor restlessness, over-activity, restlessness, over-exercise
Drive for exercise/Hyperactivity

- A voluntary increase in physical activities, not motivated by pleasure or the desire to be healthy, but out of concern with body weight (burning calories, ignoring hunger) and appearance.
Psychological mechanisms

• Effective method to spend calories and lose weight

• Form of emotion-regulation to diminish negative feelings

• Escape form feelings of emptiness

• Behaviour that has become stereotyped ritualised, compulsive
The therapy

= not spectacular

= step by step

What is body image therapy? Definition

• a method of treatment
• “The body in movement”
• a body image assessment
• in a methodical way
• in consultation with the patients
• to realise clearly formulated goals

“The core of body image therapy in eating disorders is to optimize wellbeing and empowering the individual by promoting body and movement awareness bringing together physical and mental aspects and based on the available scientific and best clinical evidence.

“Who is the best placed within the available possibilities to fit with the person who asks for help to achieve in the short term positive results?”

“GATE”
What are the goals for a body oriented therapy?

**General information**

*The patient is the architect of her own therapy!*

*The patient is the architect of her own luck and care!*
General goals for body oriented therapy in ED

• (Re-)building a realistic self-image
  • Get tuned in to the body
  • Awareness of the changes
  • Acceptance of the changes
  • To live comfortably in their body

• Curbing hyperactivity, tensions and impulses

• Communication: Developing social skills
The theory of lenses (Probst, 2007)

Neutral lens
“How do I really look?”

External Lens
“How do others see me?”

Internal lens
“How do I see myself?”

Ideal Lens
“How would I like to look?”

“Individualized concretely formulated research goals…”

Conditions for good goals!

“SMART”

Specific – Measurable – Acceptable – Realistic - Time
Stepwise approach

- At home.
- Seven floors: to take the stairs.
- with the goal to decrease the shortness of breath

- Next week: If you don’t feel pain, you will take 3 times a week the elevator and climb stairs from the sixth floor to the seventh floor,
- You succeed if you are not short of breath. At that moment you will take the elevator to the fifth floor.

- This change in behavior will influence in a positive way my health.

- It has been proven that more exercise and climbing stairs leads to better physical health and less breathlessness,

- Within 6 months, you want to do all floors without breathing problems.

Silhouette test (Beebe, 1999)
The problem

The treatment goals [ G ]

Assessment [ A ]:
Observation & Evaluation

The treatment [ T ]
(The activities)

The evaluation [ E ]

“GATE”
Postural awareness
Breathing exercises
Relaxation exercises
Sensory & body awareness
Massage
Physical activity, yoga, tai chi
Dance & expression
Mirror exercises
Problem solving exercises in group
Guided imagery exercises
Self-confrontation
Psycho-education
Posture

- As consequences of extreme and prolonged weight loss different complaints about defects and deformities of the trunk and posture problems arise.

- Scoliosis, lumbar lordosis and kyphosis, wing stand shoulder blades.

- During recovery: attention for posture and balance of the strength of the various hypo-and hypertonic muscle groups.
Body/movement awareness

• “Body awareness is the ability to pay attention to ourselves to feel our sensations and movements online, along with the motivational and emotional feelings that accompany them in the present moment, without the mediating influence of judgmental thoughts”. [Fogel 2009]

• **Focus:** external and internal support, touch, power, balance, Stretching - tension – relaxation, rhythms,

• Mensendieck, Feldenkrais, Alexander, BBAM, Pilates, KBT,
Relaxation exercises

• Relaxation of Bernstein & Berkovec, based on the progressive relaxation

• Autogenous training
• Tai chi
• Massage
• Yoga
• Mindfulness
Breathing exercises

- especially those aimed at a lowering respiration frequency, amplifying abdominal respiration, and lengthening expiration - are often included in relaxation training.

- *The objective is not just to regulate respiration, it also facilitates learning how to sense one's own body.*
Sensory awareness training

• These exercises aim at *discovering the body* through the senses in a non-threatening manner.

• *Being conscious of internal sensations* has a direct effect on the ability to recognize feelings. It is also the step to perceiving a mutual relation between bodily sensations and feelings.
  
  – *Body boundary exploration* concentrates on tactile awareness of the difference between one's body and the outside world.
  
  – *"Body scanning"* ("trip around the body") is a tactile exercise to explore the external manifestations of the body through touching and feeling of the body boundaries
  
  – *Mindfullness exercises*
Intervention

- Mild, non judgemental, curious, respectful way
- To be more aware or familiar with the body
- The whole body & body parts (frontal and profile image)
- Psycho education
- The mental image
- Relation with self esteem
- Confrontation with their own
- Responsibility
- Discussion

Invitation
2 x /week: At 9 AM and 1PM
½ hour & ¼ hour discussion

Negative thought: “My belly is too fat”

Alternative thoughts:
• My belly isn’t fat at all, perhaps I am wrong
• With this low weight, my belly cannot be fat
• I have a small size in clothing so my belly cannot be fat
• Others never make any remarks about my belly
• Perhaps I am too critical regarding my looks
• 1 year = 365 days * 24 hours * 60 minutes = 525600 minutes or 8760 hours

• How many minutes do you think somebody else will see your belly?

• 1% percent means 5256 minutes or 87 hours
Guidelines for physical activity?

• An immediate suspension of all physical activity?

• Is this the solution?
  • No!
  • Better = Appropriate physical activity
    • Under supervision
    • Without supervision
  • Benefits
    • Strength
    • Self-efficacy
Alternatives for a suspension

• A dialogue with the patient
• Psycho-education
• Finding a acceptable balance for the patient and the treatment taking in consideration the context of the patient

• BMI: <14: basic physical activity (light housekeeping activities)
• BMI: 14-16: mild physical activity under professional supervision
• BMI: 16-18: the patient receives more responsibility; the role of the professional is coaching
• BMI: >18: the patient receives all the responsibilities
Therapeutic guidelines

• Don’t believe that the behavior will change if patients deny their problems

• A soft or a more strict approach, it is always searching for a balance and sometimes therapists are confronted with their limits and with feelings of impotence/ powerlessness.

• The attitude of body oriented therapist is in the first place focused on the present healthy possibilities of the subject (=‘care’) to influence the psychological, social and somatic functioning.
Themes for Psycho-education

• The body
  • The misconception about the (functioning) body
  • The misconception about hunger (feelings of hunger), fat distribution

• Exercises
  • What constitutes exercises?
  • The misconceptions about exercises (feelings about exercise)
  • To explain the energy balance

Over-valuation
Of weight and appearance

Focus on other life domains

Decreasing the importance of weight and appearance
Patients have to convince themselves!
Twice a day, everyday; Speaking in the I-form

• I will ask myself: what do I really gain from preoccupation with what I believe are defects in my shape?

• I will think of three reasons why my assumption that thinner people are happier and “better” is ridiculous.

• I will repeat these of myself whenever I feel the urge to compare my body shape with that of another person.

• I will exercise for the joy of feeling my body move and function effectively, not to purge fat from my body or compensate for calories eaten.

• I will not avoid activities I enjoy, even if they call attention to my weight and shape.

• I will constantly remind my self that I deserve to do things I enjoy (e.g., dancing, swimming, sunbathing) no matter what my shape!
Body Mind relationship
Dearest Belly

When I look at my body, you are the part that I hate the most. I don’t know why you're so important in my life. You decide who I am and how I feel. It's just like you encourage me every day, and after every meal, to vomit. I sometimes think you’re so fat! Why can’t you just stay thin? I hate to be confronted with you day after day. Because I hate you so, you obstruct a part of my healing. Why do I have the feeling that everything I eat is stored in my belly? There is not an hour that goes by without thinking of you. I don’t want this anymore. I want to go on, whether or not you want to help me out. I won’t let you live my life, but from now on I take matters into my own hands. I was a happy woman and I still have everything to be that happy woman again. You can’t take that away from me. You're a part of me that will always be difficult for me, but gradually I will try to accept you. Give me some time and I really hope that we can be buddies for life in the future. What do you think?

Love

Bianca.
Dear Bianca,

Why do you worry so much about your belly? I'm just a body part, just like any other. I don't want you to worry about me. Everyone has a belly. It's normal that your stomach isn't very tight and you have a full feeling after your meals. A belly has its own shape, but that is typically female. You should be happy that you look so beautiful. Accept me as I am and you'll see that I won't change so much. Instead of beating or pinching me, try to give me some extra attention sometimes by rubbing me with a body lotion. I really like.

As you write in your letter, you were once a very happy woman. You can still be that. Do not worry about how you want me to be, but accept me as I am. Once you stop worrying about me, we can be good friends. I would love to see you happy again in the near future. Didn't I hear you talking to your boyfriend about getting babies, how you long for your first child? I'd be honored to feel your baby inside me. Think about that. If you want children, you have to let go and accept me as I am!

I know you can, and that you will soon be the happy girl who you were before. We continue working on our friendship.

Greetings

Your Belly
Cash, 1995 (adapted)

- Therapeutic guidelines
  - Try to understand the body dissatisfaction of the patient
  - Invite patient to make the history of body dissatisfaction/self esteem
  - Identify and correct the cognitive errors/ identify qualities
  - Invite patient to start a dialogue with your body/ Teach them to know themselves
  - Help patient to perceive the body in an adequate way/ teach them to convince themselves
  - Teach patient not to avoid confrontation with her body
  - Stimulate patient to live today in harmony with her body!/ teach them to be proud of themselves
  - Try to decrease their perfectionism and motivate them to increase interpersonal relationships
Take home messages

• BOT can have an added value for patients with eating disorders
• If you underpin your therapy with a scientific theory
• The exercises of themselves are not therapeutic; don’t copy/paste.
• Don’t expect spectacular outcome.
• Therapy is a long-lasting process; step by step; and small steps
• Be critical and don’t believe to much yourself.
• Be not afraid about silence;
• Use in communication the ideas of “motivational interviewing”
Changes in therapy

- Extra therapeutic change (client & environment) (40%)
- Common factors (30%)
- Specific factors (techniques, ...) (15%)
- Expectancy (placebo effect) (15%)

Lambert and Barley, 2001

Common factors
- Client characteristics e.g. positive expectations
- Therapist qualities e.g. allegiance to a theory
- Change processes e.g. practice of new behaviours
- Treatment structures e.g. rituals
- Relationship e.g. alliance therapist-client

(Received 14 March 2013; final version received 11 August 2013)
Does body image therapy have a more value for patients with eating disorders?

Subjective experience of ED patients with PT

- 82% of patients (N=100) indicated that they were satisfied with the body image therapy.
- The confrontation exercises prove very valuable and influence in a positive way the problems
- Patients with eating disorders experience the body image therapy as valuable
- Patients mentioned that it should be part of a treatment for patients with eating disorders.

‘Body oriented therapy is not finding a solution, it is about starting a dialogue between the patient and his/her body’
